Five complementary views of one count-source comparison
A Scatter
B Hexbin counts
C Smoothed density contours
D Marginal distributions
E 2D binned density
Rounded RSEM log2 fold change
STAR log2 fold change
Aif1
Pycard
STAR
Rounded RSEM
Gene-distribution density
Log2 fold change
The same 127 testable genes
appear in all five views.
Young terminal cerebellum.
Shared animals and sequencing reads.
Agreement is a count-source sensitivity,
not an independent replication.
Genes, bins and density estimates
do not increase animal n.
