Spatial gene localization and donor flight effects

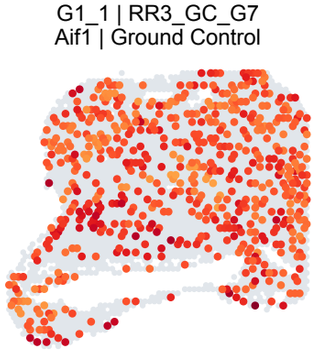

Verified coordinates: 29,839 spots, 12 sections, six mice. Displayed sections are the first technical section of each donor.

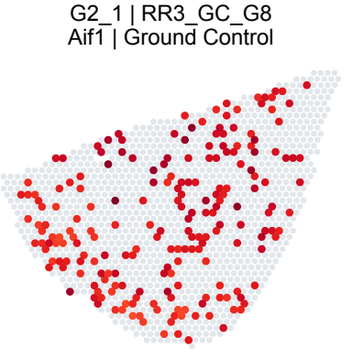

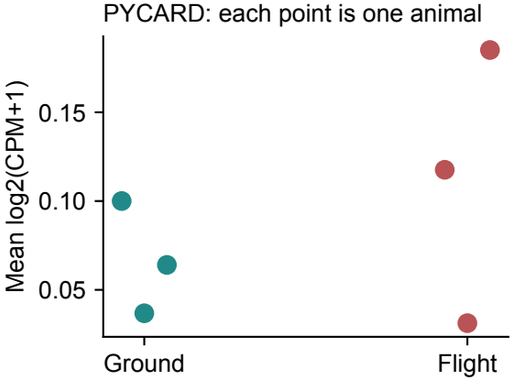

Aif1: 6/12 sections show corrected spatial structure; sparse sections retain p=1.

Pycard: 2/12 sections show corrected spatial structure; sparse sections retain p=1.

Neither lead has a corrected six-animal flight effect. Spatial clustering does not establish a spaceflight-induced mechanism.
