The complete RR23 junction profile does not show aggregate transfer to RRRM2

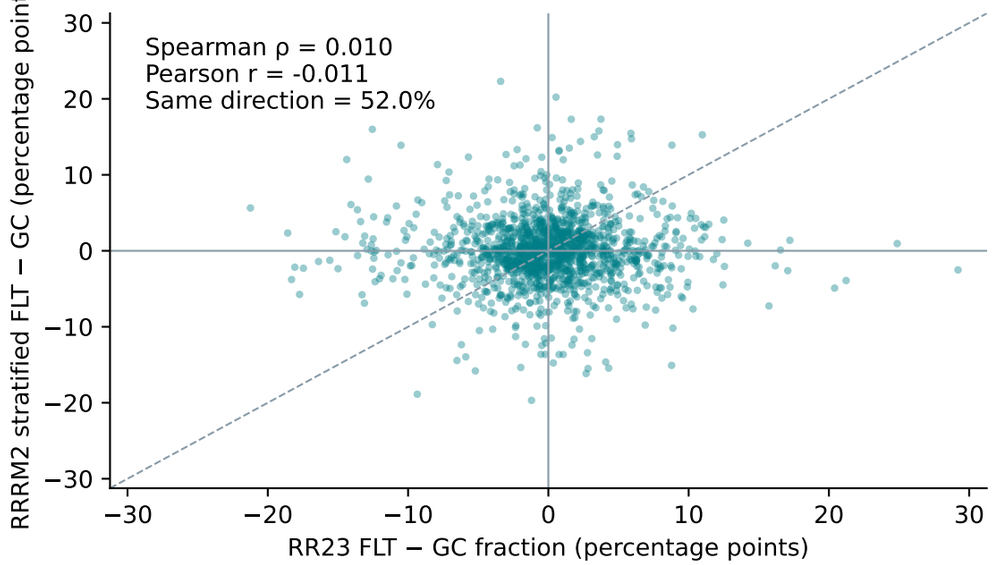

Independent launch · cerebellum · fixed RR23 directions · 19 held-out animals in three route–age strata

A Measurement transport limits the panel

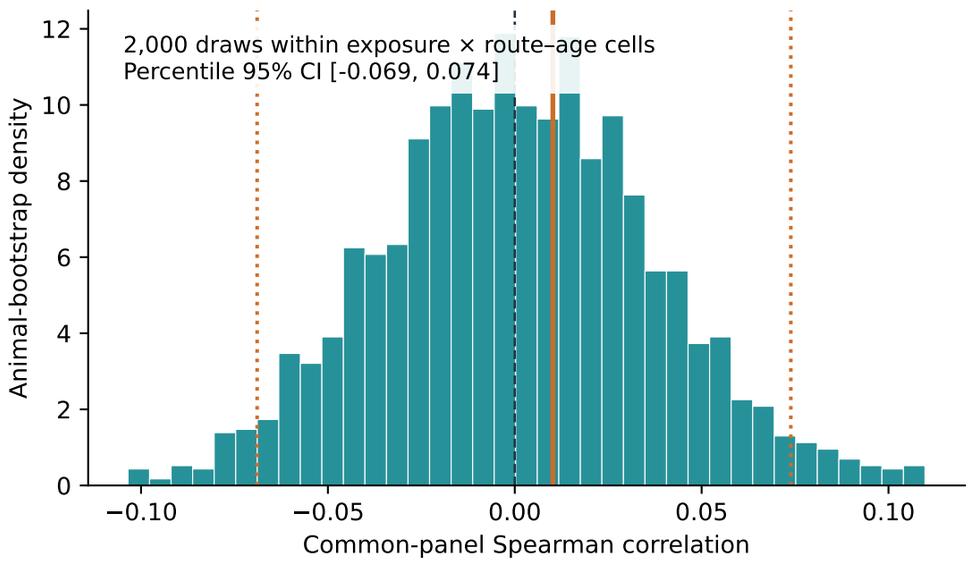

28.8% of the RR23 measured panel is measurable in both cohorts.
RRRM2 failures: 2,436 coverage only; 75 dominance only; 1,226 both.

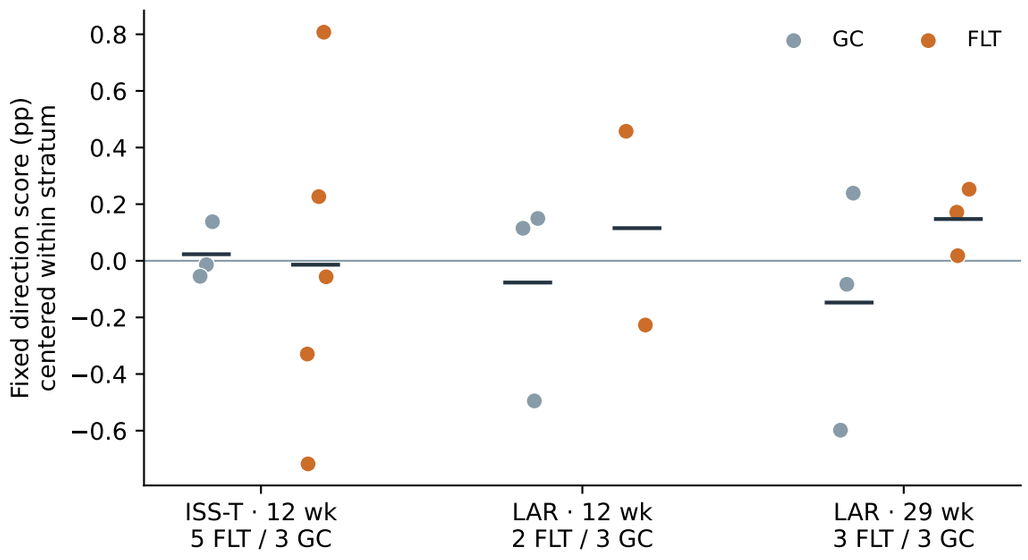

B Complete common panel: 1,512 events

C Animal resampling leaves correlation near zero

D Held-out animal score does not validate

Stratified score Δ = 0.128 pp; exact one-sided p = 0.253
11,200 labels preserving FLT counts within every stratum

All eligible events used; no RR23 significance filter. Measurement: ≥20 pair reads and ≥90% boundary dominance in every animal.
RR23 flight and collection day are aliased. Results describe cohort associations and do not establish causal flight effects or functional injury.
